ABSTRACT

Background: The hygiene level of the premise reflect the safety and quality of the food served in the food services kitchen and the poor sanitary condition can contribute to food poisoning outbreaks. Recently, many food poisoning cases reported from food services sector and most of the cases are from institutional food services. These premises sometimes are graded as clean or very clean which can be questioned, mostly at institutions such as schools. Objectives: The aim of this research is to establish mathematical models using multiple linear regression (MLR) technique to determine the food safety level and premise grading of active caterers in Pahang State, using artificial neural network.

Methods: In this research, the premises have been categorised into 3 categories namely institutional, event caterers and premise at Rest and Rescue Area (RnR) along the East Coast Highway. A total of 268 premises were involved in this study with 139 (51.87%) institutional, 63 (23.51%) event caterers and 66 (24.63%) RnR. The instrument used in this research is based on the official risk based premise inspection form currently used by Ministry of Health Malaysia. The important focusing items in the inspection form are process control, building and facilities, equipment and utensils, cleaning and maintenance, as well as food handler's requirements. These items consist of a total thirty (31) elements with respected weight age score based on risk to food safety. In this research, stepwise method is used where several significant models will be developed.

Results: The results show that the best and significant model is the 33rd model where the independent variables explain 100% of the dependent variables (R-square=1.00, p-val=0.00).

Conclusion: As a conclusion, it is expected that this system will help the related authorities by confirming national standards and create more uniformity in catering inspections. In the future, it is suggested that the result can be improved by revising **Part A:** Process Control, in the Malaysian premise inspection form where the elements should be elaborated more details by comparing to the ones used in other countries.

INTRODUCTION

Food safety has become an important agenda of the authorities worldwide from the increases of the related food borne illness. Many factors can contribute to the food borne illness such as lack of hygiene during handling process, inadequate storage and cooking temperatures. (Hai, Wan Nadhirah Wan Chik, Fatimah Abu Bakar, Nazamid Saari, and Nor Ainy Mahyudin, 2012; Osimani and Clementi, 2016).

In Malaysia, the preparation and sales of food are regulated by Malaysian Food Act 1983, Food Regulations 1985 and Food Hygiene Regulations 2009. The food must be free from any hazardous material and fit for human consumption. This Acts and Regulation also cover the requirement for the food preparation including the premises structures, maintenance, cleaning and food handler's requirements which all food handlers shall undergo food handlers training and being vaccinated (Food Act 1983, n.d., Food Hygiene Regulations 2009, n.d.). In modern society culture has resulted in an increasing number of people consuming meals away from home (Osimani and Clementi, 2016), and this also happen in

Malaysia which eating out was a common among the Malaysian urban society (Noraziah Ali and Mohd Azlan Abdullah, 2012). This increasing pattern, the food premises or food services provider has a bigger role in in contributing to food borne illness (Henson et al., 2006). Consumer need a current information about the premises to choose. Inspection grading and score is one of the method can easily interpreted by the consumer in assessing the food safety risk in the food premises which there are many other unobservable safety elements by the consumers. This paper consists of five sections. The first section is the introduction and background of this research. The second section is about the related literatures on food catering and food services followed by food premises inspection and food safety contributing factors in catering services. The third section is the methodology which include the instrument, research design and description of MLR, then followed by result and discussion in fourth section and conclusion in the final section.

Premise Inspection and Grading

Premise inspection is process of evaluation of food premise using a specified checklist which include all related element in food processing, handling, hygiene, maintenance and the building condition. The instrument and checklist used by regulatory authorities are develop based on mathematical and scientific procedures (Diogo Thimoteo Da Cunha, Rosso, and Stedefeldt, 2016). This checklist type of inspection allows a score to be calculate and translate into grade or symbol. This symbol then posted for consumer for easy evaluation of the premise current hygiene status (Costa, Puckett, Scott, and Robert Gravani, 2003). Food premises inspection is the onsite process of evaluation of the premises condition and operational status at the time of inspection, while combining with risk based will have a more meaningful result compared to traditional methods. (Hoag, Porter, Uppala and Dyjack, 2007). The risk based inspection will focus on the risk factors that may cause food borne diseases and this method will support the ultimate purpose of safeguarding the consumers (FAO/WHO, 2009). Premise inspection and grading system have been practiced worldwide. There are two main type of grading system mainly practice. The pass/fail or symbol/grading (NSW Food Authority, 2011). The purpose of having grading system is a commitment of the regulatory body to signalling the consumer about the status of the premises and its food safety risk associated with (Henson et al., 2006), and at the same time increasing the transparency to the consumer. The consumer can make their own judgment about the premises. Similar programme was introduced by The Danish Government so called "Smiley Scheme" in 2001 and "Score on The Doors" by United Kingdom in 2004, the results are published at the premises. This action will help the consumers to identifies the hygiene information inspection of the premises. In the "Smiley Scheme" (Smiley face ranging from big smile to sad face) are posted at the premises entrance while in UK the results also available online for consumers viewing. (Djekic et al., 2014). Premise inspection is a one way to unsure the food services follow the minimum requirements of the regulation and the violation of certain point of inspected element during food premises inspection reduced during the second inspection compared to the first inspection(Diogo T. da Cunha et al., 2016; Kwon, Choi, Liu, and Lee, 2012; Wong et al., 2015). The inspection itself can take as awareness among the premises owner. In early implementation, this grading approach is more acceptable by the by many consumer groups

but is not supported by industry and has received mixed reactions from regulatory agencies (Costa *et al.*, 2003). Nowadays, this grading system for food premises are being accepted and used by many municipal and authority such letter grade, numerical scores, coloured cards, symbols such star and smiley faces (Diogo T. da Cunha *et al.*, 2016; Djekic *et al.*, 2014; NSW Food Authority, 2011).

Advantages and disadvantages of grading System

Wong et al.(2015) found that the premises got good score in first inspection will maintain the grade for the next inspection. This shows that the commitment of the premise owner in maintaining the hygiene and cleanliness their premises which is directly beneficial to the owner and indirectly to consumer. At the same time this will decrease the number of inspection by the regulatory authority. As study done by Jin and Leslie, (2005) shows that the premises with good grade (e.g A and B) have an increment in revenues by 5.7% and 0.7 % respectively while the C Grade having negative impact by decreasing revenues by an average 1%. The grading system also facilitate to decrease risk for food borne related to hygiene practice such as violation for inadequate hand washing facilities and workers hygiene (Wong et al., 2015) and supported by analysis done by (Jin and Leslie, 2005) shown that the percentage of admitted people which related to food related illness was decreased by 20% in Los Angeles. The grading system also helping the customers to make a decision with simple symbol or grading posted on the premises and this also supported by (Wong et al., 2015) where their study in New York suggested that customers approve the grading programme and use it when making decision on premise selection.

MATERIALS AND METHODS

Instrument

The inspection form used in this study are the standard risk based food premise inspection by Ministry of Health Malaysia (MOH). This form used by MOH in obtain the compliance of the caterers to the Malaysia standards and regulations which contain a total of thirty (31) elements under the thirteen (13) main section as listed below;

- A. Process Control (25)
- B. Building (7)
- C. Food Handlers (13)
- D. Equipment and Utensils, Food Preparation Area (9)
- E. Water Supply (5)
- F. Drainage and Plumbing (3)
- G. Sanitation Facilities (6)
- H. Waste Management (2)
- I. Pest Control (3)
- J. Premise Cleaning and Maintenance (2)
- K. Transportation and Delivery (1)
- L. Others Operation (1)
- M. Others Process (Related to Public Health Risk) (10)

Research design

Figure 1 shows the research flowchart. This study was conducted between Mac 2017 until October 2017. A stratified random sampling procedure was used for selecting the participants in this study and a total of 268 caterers was selected from three type of caterers namely institutional, event caterers and RnR Caterers in Pahang State.

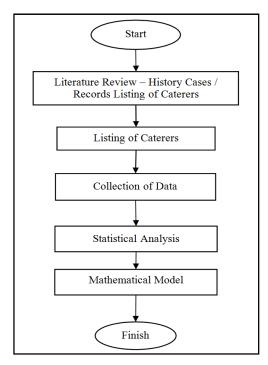

Figure 1. Research Flowchart

The proportion of the sample are 66 (24.63%) RnR, 63 (23.51%) event caterers and 139 (51.87%) of institutional caterers. The each selected caterers were inspected using standardize risk-based inspection form used by Ministry of Health Malaysia which focusing on the risk at the onsite food preparation.

This form is formally used by MOH in obtain the compliance of the caterers to the Malaysia standards and regulations which contain a total of thirty (30) elements under the thirteen (13) main section as in Table 1. All 268 data collected were analysed using Neural Network SPSS, IBM SPSS Statistics for Windows, Version 22.0.

Multiple Linear Regression

Table 1 represents the variables used in this research as well as the explanations of each variable, and illustrates the theoretical framework of this research in order to achieve the main objective. In this research, we adapted multiple linear regression, stepwise method. Several models will be developed and the best model will be selected eventually. A linear regression model that contains more than one predictor variable is called a multiple linear regression model. The following model is a multiple linear regression model with thirty two predictor variables,

$$\begin{split} & x_{1}, x_{2}, x_{3}, x_{4}, x_{5}, x_{6}, x_{7}, x_{8}, x_{9}, x_{10}, x_{11}, x_{12}, x_{13}, x_{14}, x_{15}, x_{16}, x_{17}, x_{18}, \\ & x_{19}, x_{20}, x_{21}, x_{22}, x_{23}, x_{24}, x_{25}, x_{26}, x_{27}, x_{28}, x_{29}, x_{30}, x_{31}, x_{32}, x_{33}. \\ & Y = \beta_{o} + \beta_{o} * x_{1} + \beta_{2} * x_{2} + \beta_{3} * x_{3} + \beta_{4} * x_{4} + \beta_{5} * x_{5} + \beta_{6} * x_{6} + \beta_{7} * x_{7} + \beta_{8} * x_{8} + \beta_{6} * x_{9} + \beta_{10} * x_{10} + \beta_{11} * x_{11} + \beta_{12} * x_{12} + \beta_{13} * x_{13} + \beta_{4} * x_{14} + \beta_{15} * x_{15} + \beta_{6} * x_{16} + \beta_{17} * x_{17} + \beta_{8} * x_{18} + \beta_{9} * x_{19} + \beta_{20} * x_{20} + \beta_{21} * x_{21} + \beta_{22} * x_{22} + \beta_{23} * x_{23} + \beta_{24} * x_{24} + \beta_{25} * x_{25} + \beta_{26} * x_{26} + \beta_{27} * x_{27} + \beta_{28} * x_{28} + \beta_{29} * x_{29} + \beta_{30} * x_{30} + \beta_{31} * x_{31} + \beta_{32} * x_{32} + \beta_{33} * x_{33} + \varepsilon \end{split} \tag{1}$$

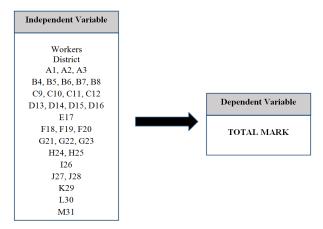

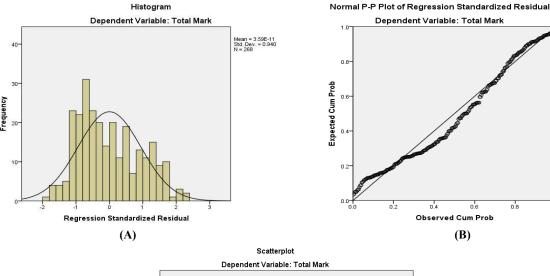

Figure 3. Theoretical Framework

The model is linear because it is linear in the parameters β_0 , β_1 , β_2 , β_3 , β_4 , β_5 , β_6 , β_7 , β_8 , β_9 , β_{10} , β_{11} , β_{12} , β_{13} , β_{14} , β_{15} , β_{16} , β_{17} , β_{18} , β_{19} , β_{20} , β_{21} , β_{22} , β_{23} , β_{24} , β_{26} , β_{27} , β_{28} , β_{29} , β_{30} , β_{31} , and β_{32} . The parameter β_0 is the intercept of this plane. Parameters β_1 , β_2 , β_3 , β_4 , β_5 , β_6 , β_7 , β_8 , β_9 , β_{10} , β_{11} , β_{12} , β_{13} , β_{14} , β_{15} , β_{16} , β_{17} , β_{18} , β_{19} , β_{20} , β_{21} , β_{22} , β_{23} , β_{24} , β_{26} , β_{27} , β_{28} , β_{29} , β_{30} , β_{31} , β_{32} and β_{33} are referred to as partial regression coefficients. In this research, the general model is

The final model will include only the significant predictors to explain Total Mark.

RESULTS AND DISCUSSION

Table 2 shows the descriptive statistics of the variables in this research. Based on Table 3, it is clear that there are 33 significant models possible to explain the Total Mark, which determines the grade of the premise. This can be proven by the ANOVA, Table 4 which clearly proof that all the 33 models are significant where p<0.05. However, using stepwise method, the best model was the 33^{rd} model.

The coefficients are as shown in Table 5. Table 6 shows the residual statistics for model 33. The 33rd model is reliable since the standardized residuals are normally distributed as proven by Figure 2 (A), Figure 3(B) and Figure 3(C). The best model to determine Total Mark is

 $TotalMa\#10.10\%Wokes+0.39\%A+0.33\%A+0.24\%I26+0.25\%C12+0.22 \&D13+0.16\%B5+0.19\%C10+0.21\%A2+0.16 \&D15+0.13\%B6+0.18\%C11+0.14 \&M31+0.14\%G23+0.14\%D16+0.09\%E17+0.04\%H25+0.05\%F18+0.073J27+0.06\%D14+0.06\%H24+0.04\%F20+0.032\%F19+0.034*B7+0.034*L30+0.03 \&J28+0.024*B4+0.02\%B8+0.010\%C21+0.010\%K29+\varepsilon$

Conclusion

The objectives are well-achieved. The significant factors to determine the grade of a premise are:

- Food handlers' health examination
- Control of cross contamination
- Critical control points
- Effective pest control
- Training and records
- Food Contact Surface
- Suitable floor condition
- Food handlers practice
- Raw materials specification
- Hygiene facilities and method
- Suitable floor and wall
- Protective clothing
- Risky other related activity
- · Complete hand washing facility

- Suitable storage and FIFO
- Adequate and safe water supply
- Maintenance of disposal area
- Effective waste water
- Cleaning and maintenance
- Non-food contact surface
- Adequate waste bin
- Plumbing well fitted
- Plumbing no cross and back flow
- Adequate lighting
- Other documentation
- Separate storage cleaning chemical
- Away from source of contamination
- Adequate ventilation
- Transportation condition

The food handler's knowledge is very important in maintaining of the hygiene and safety of the food in the catering premises. Knowledge and behaviour are better among who had middle or higher school education combining with working experience in the catering sectors which the food handlers learn more throughout their daily task and hearing the basic theory of hygiene and food handling (Garayoa, Vitas, Díez-Leturia, and García-Jalón, 2011). Improper handling of food can lead to food poisoning through many factors. As reported in Taiwan, the primary cause of food poisoning is cross contamination (between raw and cooked food), insufficient heating, long holding period at room temperature, contamination by infected food handlers and contaminated by inadequately cleaned equipment (Ko, 2013). While in United State the risk factor which related to food poisoning are listed as improper holding temperatures, inadequate cooking, contaminated equipment, unsafe source; and poor personal hygiene (U.S Food and Drug Administration Public Health Services, 2015). The hygiene level of the kitchen and the food handlers practice is very important in maintaining the safety of food prepared such as temperature controls and most of the working surface in the kitchen. In Malaysia, the reported main reason for foodborne illness is related to insanitary food handling procedures which contribute 50% of the cases (Abdul-Mutalib, Syafinaz, Sakai, and Shirai, 2015). In future work, this research will be extended throughout all Malaysian states.

Acknowledgement

Millions of thanks to Food Safety and Quality Division (FQCD), Pahang State Health Department as well as Food Safety and Quality Division (FQCD), Ministry of Health Malaysia for all the supports and expertise given throughout this research. The authors also wish to thank the International Islamic University, Malaysia, and MOHE for the research grant awarded to this project, RIGS 16-092-0256 and RIGS 16-321-0485.
