ABSTRACT

The present investigation was aimed to evaluate the growth inhibitory effect of Hibiscus rosasinensis, Azadirachta indica, Ficus religiosa and Ocimum sanctum leaves extracts on Aspergillus niger, Candida albicans, Cunninghamella bertholatiae and Penicillium notatum. Aquous plant extracts were tested against 4 fungi. Gel diffusion method, were used in this investigation. The Azadirachta indica medicinal plant extract 11 mm (Mean value in Dia.) were showed enormous antimicrobial activity against Aspergillus niger, Candida albicans and Cunninghamella bertholatiae. Ocimum sanctum medicinal plant extract showed the maximum zone of inhibition 11 mm (Mean value in Dia.) against Penicillium notatum. Moderate amount of antifungal activity was observed on Hibiscus rosasinensis medicinal plant extract, the maximum zone of inhibition 7 mm (Mean value in Dia.) against Aspergillus niger. At the same time Hibiscus rosasinensis plant extract was highly sensitive 11 mm (Mean value in Dia.) against Candida albicans. All the pathogenic fungi were more resistance to Ficus religiosa medicinal plant extract. The present observation, the Azadirachta indica and Ocimum sanctum medicinal plants extracts were showed very promising antifungal activity.

INTRODUCTION

The development of freshwater aquaculture in the country only finally became established following the establishment of the Pond Culture Division at Cuttack in 1949 under the name of the Center of Central Inland Fisheries Research Institute (CIFRI), West Bengal. Significant developments took place thereafter with the standardization of induced breeding techniques and the development of hatchery systems and composite carp culture with the three Indian major carps and three exotic carps, including silver and grass carp, forming the basis for carp polyculture systems. The Food and Agricultural Organization of the United Nations (FAO, 2009), state that illness due to contaminated food is perhaps the most widespread health problem in the contemporary world and an important cause of reduced economic productivity (Edema et al., 2005). Fungi are known to attack fish eggs, fry, fingerlings and adult fish. Water molds infections cause losses of freshwater fishes and their eggs in both natural and commercial fish farms (Bangyeekhun and Sylvie, 2001).

The fungal diseases occur in brood stock and all life stages of fish and eggs. Fungal infection cause low productivity of fry and low production in fish culture (Kwanprasert et al., 2007). The mortality rate due to fungal infection may reach some time up to 80-100% in incubated eggs. According to post-harvest handling of fishes may also result in infection with microorganisms such as bacteria and fungi (Akande and Tobor, 1992).

Drug resistance is a serious global problem, and spread of resistance poses additional challenges for clinicians and the pharmaceutical industry. Use of herbal medicines in the developed world continue to rise because they are rich source of novel drugs and their bioactive principles form the basis in medicine, nutraceuticals, pharmaceutical intermediates and lead compounds in synthetic drugs (De and Ifeoma, 2002 and Neube et al., 2008). Screening medicinal plants for biologically active compounds offers clues to develop newer antimicrobial agents. These compounds after possible chemical manipulation provide new and improved drugs to treat the infectious diseases (Natarajan et al., 2003 and Shah et al., 2006). Plant based products extracts are cheaper alternatives to the development of synthetic drugs.
The plant-derived medicines are based upon the premise that they contain natural substances that can promote health and alleviate illness. So returns to natural substances are an absolute need of our time (Kumar et al., 2007). In the last few years a number of studies have been conducted to verify the effectiveness of plant extracts against bacterial infections (Prashanth et al., 2006; Ung et al., 2010). Azadirachta Indica belongs to the family Meliaceae, commonly known as neem. It is used in traditional medicine as a source of many therapeutic agents. A. indica (leaf, bark and seed) are known to contain antibacterial, antifungal activities against different pathogenic microorganisms and antiviral activity against vaccinia, chikungunya, measles and coxsackie B viruses (Biswa et al., 2002). Different parts of neem (leaf, bark and seed oil) have been shown to exhibit wide pharmacological activities including; antioxidant, antimalarial, antimutagenic, anticarcinogenic, antiinflammatory, antihyperglycaemic, antiulcer and antidiabetic properties (Telwar et al., 1997). The biological activities are attributed to the presence of many bioactive compounds in different parts. The present study evaluated the individual and in combination growth inhibitory effect of 4 medicinal plant extracts against 4 fungi.

MATERIALS AND METHODS

Plants were collected between the month of June and July 2016 in the Thanjavur area Tamil Nadu, India. Plant leaves were initially dried in an air-conditioned, dehumidified room, then further dried in an oven at ca. 40°C for a total of seven days, and then finally ground to a fine powder. Antimicrobial activity test was determined by the Kirby-Bauer disc diffusion method (Bauer et al., 1966).

The Antimicrobial activity was tested against isolated 4 fungal strains. The medicinal plants of Hibiscus rosasinensis, Azadirachta indica, Ficus religiosa and Ocimum sanctum leaves extract were tested by the disc diffusion method. The extracts were prepared by reconstituting with aqueous. The test microorganisms were seeded into respective Potato dextrose agar medium by spread plate method 10 μl (10 cells/ml) with the 72h cultures of fungal growth in Potato dextrose agar broth. After solidification the filter paper discs (5 mm in diameter) impregnated with the extracts were placed on test organism-seeded plates., Escherichia coli, Salmonella typhi, Staphylococcus aureus and Enterobacter aerogen were used for antibacterial test. Erythromycin (10 μg mlG1) used as positive control. The antibacterial assay plates were incubated at 37°C for 72h. After incubation, the results were observed and measured the diameter of inhibition zone (mm) around the each well.

RESULTS AND DISCUSSION

Antifungal activity of medicinal plant extracts such as Hibiscus rosasinensis, Azadirachta indica, Ficus religiosa and Ocimum sanctum (Leaves) were tested against some pathogenic fungi such as Aspergillus niger, Candida albicans, Cunninghamhamella bertholatiae and Penicillium notatum. The different pathogenic fungi were quantitatively assessed for zone of inhibition. The resulted were presented (Table 1, Fig. 1 and Plate 1).

The antimicrobial activity test with medicinal plant extracts such as Hibiscus rosasinensis, Azadirachta indica, Ficus religiosa and Ocimum sanctum (Leaves) were studied against selected fungal pathogens. The selected fungal strains such as Aspergillus niger, Cunninghamhamella bertholatiae, Candida albicans and Penicillium notatum. The Azadirachta indica medicinal plant extract 11 mm (Mean value in Dia.) was showed enormous antimicrobial activity against Aspergillus niger, Candida albicans and Cunninghamhamella bertholatiae. Ocimum sanctum medicinal plant extract showed the maximum zone of inhibition 11 mm (Mean value in Dia.) against Penicillium notatum. Moderate amount of antifungal activity was observed on Hibiscus rosasinensis medicinal plant extract, the maximum zone of inhibition 7 mm (Mean value in Dia.) against Aspergillus niger. At the same time Hibiscus rosasinensis plant extract was highly sensitive 11 mm (Mean value in Dia.) against Candida albicans. All the pathogenic fungi were more resistance to Ficus religiosa medicinal plant extract. The Azadirachta indica and Ocimum sanctum medicinal plants extracts were showed very promising antifungal activity. The Azadirachta indica medicinal plant extract were showed enormous antimicrobial activity against Aspergillus niger, Candida albicans and Cunninghamhamella bertholatiae, when compared with other medicinal plant extracts. According to Winee Surabhi Lall et al., (2013) were studied the methanolic and acetic extracts of the three medicinal plants possesses antifungal activity against A. niger and A. fumigatus with the maximum zone of inhibition against A. niger 22 mm for methanolic extract of Curcuma longa and the minimum inhibition was shown by acetic extract of Azadirachta indica against A niger 8 mm. According to Nishant Rai et al. (2011) were studied the petroleum ether and methanolic extracts of Azadirachta indica exhibited high activity against Candida albicans (15-18mm).

Lalit Mohan et al., (2011) were reported that the Ocimum sanctum also possesses antifungal activity against Aspergillus niger and aequous extract of it was found to be effective in patients suffering from viral encephalitis.6 In the treatment of ring worm infections, Tulsi leaves paste is indeed found to be very effective. Tulsi has significant natural antibacterial, antiviral and antifungal activities and is helpful in treating many serious systemic diseases, as well as localized infections. Many similar studies reported differences in antibacterial and antifungal activity of different medicinal plant extracts and the differences were rationalized as due to differend in morphological structure of the cell membranes (Mazutti et al., 2008 and Rang et al., 2001). Different plant extracts have been reported for their antifungal properties (Al-Fatimi et al., 2007; Afolayan et al., 2002), which supports our present findings. There is very little information available on the activity of medicinal plants aromatic and medicinal plants are known to produce certain bioactive molecules which react with other organisms in the environment, inhibiting bacterial or fungal growth (antimicrobial activity).

The substances that can inhibit pathogens and have little toxicity to host cells are considered candidates for developing new antimicrobial drugs. The present study similar workers reported (Chopra et al., 1992; Bruneton, 1995).

Conclusion
In the present observation, the antifungal activity of Azadirachta indica plant extract was exhibited maximum zone of inhibition against Aspergillus niger, Candida albicans and Cunninghamella bertholletiae 15 mm (Mean value in Dia.). Ocimum sanctum medicinal plant extract showed the maximum zone of inhibition 11 mm (Mean value in Dia.) against Penicillium notatum. All the pathogenic fungi were more resistance to Ficus religiosa medicinal plant extract. The Azadirachta indica and Ocimum sanctum medicinal plant extracts were showing very promising antifungal activity.
